Anusha Garg

Canberra, ACT (open to relocating) | anusha.garg.ag@gmail.com
linkedin.com/in/anushagargg | github.com/anushagarg-10

CAREER PROFILE

Full-stack software engineer working in React, Next.js, TypeScript and Supabase. As the only web developer at a Canberra IT service management provider, independently handles websites for 30+ client businesses, from requirements and design through to deployment and maintenance. Recent work includes independently migrating 10+ client websites from WordPress to Next.js and Vercel, a multi-tenant SaaS platform, and Stripe and Kaseya integrations. Also handles Essential Eight Maturity Level 2 compliance for clients, including one in the defence industry. Holds a Master of Computing (Human-Centred and Creative Computing) from ANU and cares about design as much as code.

Key Achievements

- Built Osmia, a multi-tenant B2B SaaS platform, as the sole developer over 12+ sprints. When a key vendor API was shut off, planned a new data feed to keep the product going.
- Independently migrated and redesigned 10+ client websites from WordPress to Next.js and Vercel. On the ALRTA site, no page, document, SEO setting or old URL was lost, and maintenance and page builds are now 50% more efficient.
- Built a full Essential Eight Maturity Level 2 Intune policy set (19 profiles) for a defence industry client under the Defence Industry Security Program (DISP), and wrote the evidence for their cyber assessment.
- Went from on-site Technical Intern to full-time Software Engineer at Empreus IT Support within twelve months.

WORK EXPERIENCE

Software Engineer (full-time) Jul 2026 - Present

Empreus IT Support, Canberra, ACT

Canberra managed service provider delivering IT support, cyber security and web services to small and medium businesses.

- Handle most of the web development work independently as the sole web developer, reporting directly to the director.
- Take each project end to end: gather client requirements, design the site, then build, deploy and maintain it.
- Build and look after sites and web apps for 30+ small and medium businesses in finance, construction, hospitality, wellness and more.
- Work directly with clients to understand what they need and explain technical decisions in plain language.
- Build each site from scratch in Next.js, React and TypeScript on Vercel, each with its own look. Examples include an editorial cream-and-gold finance site and a builder's site with architectural line animations.
- Write Vitest tests, take part in code reviews and ship through GitHub Actions CI/CD. Refactor older code and integrations to keep client projects easy to maintain.
- Independently migrated, redesigned and rebuilt 10+ client websites from WordPress to Next.js and Vercel, based on each client's requirements. The full portfolio was live on Vercel by late September 2026.
- Manage DNS for 314 domains through Atlas Control, including cutovers, domain transfers and email delivery.
- Set up Google Search Console and sitemaps across the client base, and prepare security and SEO reports for clients.
- Working through a second client's Essential Eight ML2 action plan one control at a time, collecting evidence in Intune and Microsoft Defender.
- At the director's request, preparing an Essential Eight gap report across every client that has started E8. It turns one-off client jobs into a clear plan for which controls to roll out next and which clients to uplift.
- Building an application that applies Essential Eight controls to client devices automatically through Atlas Control, the company's in-house platform.
- Setting up a standard process for onboarding new web clients and maintaining existing sites, so older projects stay secure and up to date.
- Planning a security and maintenance review of every published client site.
- Use Claude Code and GitHub Copilot daily and check all generated code for correctness and security. On one upgrade, the tool warned the change could break existing data; tested it independently, found the warning did not apply and shipped the change safely.

Technical Intern / Software Engineer (part-time) Jul 2025 - Jul 2026

Empreus IT Support, Canberra, ACT

- Started on site as a Technical Intern (Jul to Dec 2025), then worked part-time as a Software Engineer (Jan to Jul 2026) while working on client websites independently and finishing a Master of Computing at ANU.
- Built Osmia, a multi-tenant SaaS platform, and delivered the ALRTA WordPress to Next.js migration (see Key Projects), leading to a full-time Software Engineer role in July 2026.
- Built a reusable React UI library of 30+ components, plus site templates, so new pages and sites never start from a blank file.
- Maintained around 20 WordPress sites on WP Engine, including Wordfence security checks, plugin updates and contact forms, before they moved to other platforms.
- Built a Stripe payment flow, end to end, for a client's web platform.
- Tracked down why a third-party API integration kept failing (timeouts, rate limits, lost pages of data) and rebuilt it with retry and backoff so client records stayed complete.
- Connected client contact forms to Resend, SendGrid and Atlas email.
- Fixed device MDM enrolment problems for a defence industry client while building their Essential Eight ML2 Intune policies.

- Packaged and rolled out the Atlas monitoring agent to client devices through Microsoft Intune.

After-School Carer and Teacher (casual) **Jan 2025 - Jul 2025**
After-school care program, Canberra, ACT
- Ran safe, organised and fun after-school sessions for school-age children while studying full-time.
- Helped children with homework and activities, and kept parents and staff updated on each child's day.

Full-time study, Jun 2024 to Jul 2025: *moved to Australia to start a Master of Computing at The Australian National University, alongside casual after-school care work and elected student leadership roles.*

Product Development Engineer (part-time) **May 2023 - Jun 2024**
BlockConvey, Remote
Web3 and blockchain technology company.
- Rebuilt the company website from Figma designs, replacing hard-to-edit static pages with reusable components and clearer navigation. The business could now update its own site 65% more easily.
- Built responsive frontend screens for Web3 features and connected them to backend services through REST APIs on AWS, Azure and Google Cloud.
- Wrote and deployed NFT smart contracts on Ethereum, using IPFS for storage and Python web3 scripts to work with them.
- Set up a blockchain network on Google Cloud and wrote a disaster recovery plan for the cloud infrastructure.
- Improved the API testing process, and cut data extraction time by 20% by simplifying how the team pulled information.

Research and Development Intern (practicum) **May 2023 - Sep 2023**
University of New South Wales, Sydney, NSW (remote)
- Built a full-stack Human Mobility QA platform in React, Node.js and MongoDB, so researchers could query and trust large, messy datasets.
- Designed the interface in Figma and built dashboards that let researchers check results without writing queries, saving 30% of their time.
- Worked with other interns and supervisors to improve how the team handled and processed data.

EDUCATION

Master of Computing (Human-Centred and Creative Computing) **Jul 2024 - Jul 2026**
The Australian National University, Canberra, ACT. Postgraduate Representative and Set4ANU Mentor.

Bachelor of Technology in Information Technology **Sep 2020 - Jun 2024**
Vellore Institute of Technology, Vellore, India. GPA 8.48/10

CERTIFICATIONS

- Working with Vulnerable People (WWVP) registration, ACT
- AWS Academy Graduate: AWS Academy Cloud, Amazon Web Services (2023)
- Machine Learning Pipelines with Azure ML Studio, Coursera (2023)
- Data Science Methodology, Coursera (2023)
- 30 Days of Google Cloud, Google for Developers (2021)
- The Complete 2021 Flutter Development Bootcamp with Dart, Udemy (2021)

TECHNICAL SKILLS

Frontend: React, Next.js (App Router), TypeScript, JavaScript, HTML, CSS, Tailwind CSS, responsive design, React Three Fiber, WebGL

Backend & Data: Node.js, REST APIs, PostgreSQL, Prisma, Supabase, MongoDB, MySQL, Firebase, Python (scripting)

Integrations: Stripe (payments), Kaseya API, WordPress REST API, LLM API integration, Resend, SendGrid, email delivery setup

CMS & Hosting: WordPress, WP Engine, Wordfence, Vercel, DNS management, domain transfers, site migrations

SEO & Performance: Google Search Console, sitemaps, redirects, SEO metadata, client SEO and security reporting

Security & IT: Essential Eight (ML2), Microsoft Intune, Microsoft Defender, Microsoft Entra ID, MDM enrolment, access controls, Atlas Control, ticketing systems

Testing & Delivery: Vitest, GitHub Actions CI/CD, Git, GitHub, code review, refactoring, technical documentation

Cloud: AWS, Azure, Google Cloud

Design: Figma, Adobe Creative Suite, design systems, component libraries, UI/UX

AI Tools: Claude Code, GitHub Copilot (used daily, output always reviewed)

Web3: Ethereum smart contracts, IPFS, web3 (Python)

KEY PROJECTS

Osmia: multi-tenant B2B SaaS (HaaS) platform | Empreus IT Support 2026

- **Context:** Empreus wanted its own multi-tenant platform, giving each business a secure space linked to its IT management data.
- **Action:** Built it end to end over 12+ sprints in Next.js, Supabase, Prisma and PostgreSQL, covering the data model, REST API, authentication, authorisation, Kaseya API sync and a cream-and-gold redesign. When Kaseya shut off API access, planned a CSV, SFTP and email replacement feed.
- **Result:** Empreus has a working multi-tenant product of its own. Batched syncing made Kaseya syncs 70 - 80% more reliable without overloading the database, and the replacement feed plan is now the agreed way to reduce reliance on a single vendor.

Future Planner: financial advisory website | futureplanner.au 2026

- **Context:** A financial advisory firm needed a modern, compliant website that made it easy for clients to get in touch.
- **Action:** Redesigned and built a responsive site with compliance disclosures, interactive team profiles and a working enquiry API.
- **Result:** Compliance disclosures are in place and client enquiries now reach the team directly online.

ALRTA website migration: WordPress to Next.js | alrta.org.au 2026

- **Context:** The Australian Livestock & Rural Transporters Association needed to leave a WordPress and Elementor site that required constant patching, without losing content or SEO.
- **Action:** Wrote a Node.js script to move every page, post, media file and SEO setting into MDX with redirects, then rebuilt the site in Next.js 14, TypeScript and Tailwind CSS on Vercel with a reusable design system, HubSpot forms, an automated news feed and 40+ documents.
- **Result:** No content was lost, and redirects kept every old URL working to protect search rankings. Maintenance and page builds are 50% more efficient, and the script is reusable for future migrations. Promoted to full-time shortly after.

Clinic 88: healthcare website | clinic88.com.au 2026

- **Context:** A healthcare clinic's WordPress site of around 70 pages needed a clearer layout, easier navigation and better SEO.
- **Action:** Migrated and redesigned the full site, improving the layout, navigation and on-page SEO, and made sure every old WordPress link kept working.
- **Result:** A clearer, easier-to-navigate site with SEO improvements built in and no broken links from the old site.

Life Unlimited: psychology website | lifeunlimited.com.au 2026

- **Context:** A psychology practice needed a website for its services and training programs, with some resources kept private.
- **Action:** Redesigned and built a 40+ page site with service information, training programs and password-protected resources.
- **Result:** The practice now runs its services, training programs and private resources from one site.

Go8 Regalia Configurator | Personal project, github.com/anushagarg-10/go8-regalia-configurator 2026

- **Context:** Academic dress differs across all eight Go8 universities, and the available data is often inconsistent.
- **Action:** Learnt React Three Fiber and WebGL from scratch to build an interactive, real-time 3D configurator in Next.js and TypeScript, backed by 51 Vitest tests and a GitHub Actions CI pipeline.
- **Result:** A working 3D configurator covering all eight Go8 universities, with automated tests so it holds up beyond a demo.

Nature Life Science | Personal freelance project, naturelifescience.in 2026

- **Context:** A botanical apothecary business in India needed a production website and visual identity built from scratch.
- **Action:** Designed the visual system from a blank page and built a fully responsive site in Next.js and TypeScript, with a typed catalogue of sixteen products and a reusable component library.
- **Result:** The business now has a live production site with its full product range online.
